

HTJ MAINTENANCE ^{INFRA}

The most important phase of an infra product's (cable, street, road, park, pumping station, etc) life cycle starts at its completion. The purpose of maintenance is to guarantee the client dependable operation of a structure or piece of equipment, now and in the future.

Maintenance (servicing) involves various maintenance and operation tasks which keep the structure operational, and overhaul tasks which return the structure to a condition the same as or close to its original condition.

HTJ also offers competency in maintenance, ranging from various content reports on maintenance tasks to maintenance work documents. Our special competency targets street maintenance and water service.

Knowledge of maintenance processes creates the opportunity to target service and repair procedures correctly, cutting down sudden service, and to invest in pre-emptive service and creating long term repair/overhaul programs.
